# FIELD MEASUREMENTS OF IMPACT SOUND INSULATION OF FLOORS

Date of Test : Tuesday, 22 September 2020

Project No.: 4225

Testing Company : Koikas Acoustics
Checked by : Nick Koikas

 Place of Test:
 Residential building in Macquarie Park

 Client
 Paxwood Pty Ltd (Clever Choice Design Floors)

Location

#### FIIC:

Field Impact Insulation Class is a single-number rating of how well a floor system attenuates impact type sounds, such as footsteps. Calculated from third-octave band normalised impact sound pressure level data and referenced to 10  $\rm m^2$  as described in ASTM E989. The higher the single-number rating, the better its impact insulation performance.

#### L'nT,w:

The Weighted Standardised Impact Sound Pressure Level when measured in situ referenced to a reverberation time (RT60) of 0.5 seconds. Used by the AAAC to determine their respective Star Rating.

#### Ci:

Spectrum adaption term is a low frequency correction factor. Typically for massive floors such as concrete, the values are about zero while for timber joist floors Ci is positive because of the low resonant frequencies. Considers frequency range between 100 -and 2500 Hz.

### Ci(50-2500):

Same as above, but for the frequency range 50 -2500 Hz.

## Ci(125-2000):

Same as above, but for the frequency range 125 -2000 Hz.
